ABSTRACT

The Intelligent Job Portal is a system developed to make job searching easier and faster for applicants. Job portals can contain thousands of job postings, making it difficult and time-consuming for users to find jobs that match their needs. This project focuses on providing a simple and efficient way to search for suitable job opportunities based on skills and location.

The system stores important details about job postings, such as job title, company, required skills, salary, and location. Applicants can enter their skills and preferred location, and the system searches through the available job listings to find suitable matches. Data Structures and Algorithms are used to store, organize, search, and retrieve job information efficiently. This helps reduce the time required to find relevant job postings and improves the overall performance of the system. The portal can also filter job listings based on user requirements, making the search process more convenient. The project demonstrates how DSA concepts can be applied to solve a real-world problem and help applicants find suitable job opportunities more easily and effectively.
